

Installing an i Series Driver

1. When you click the link from our web site, save it to your local PC or desktop.
2. Go to your saved file and double-click. The Installshield Wizard will automatically run. The wizard will walk you through the installation process.
3. If the option to Modify, Repair or Remove comes up, that is because you have an older version of driver that needs to be removed before you install the new version. Select Remove and hit next. (You will need to re-boot and re-run the installer. It will not automatically run on its own.)
4. Follow the instructions through interface selection, License Agreement, Complete or Custom set-up type (unless you know a specific custom requirement you have, you should select Complete), and Program Folder selection.
5. Select Yes to view the READ ME file. This gives valuable information and tips on successful operation of your Zebra i Series printer.
6. Click the Next button.
7. Remember to re-boot your computer.
8. You have now successfully installed your new i Series driver.
